

Photo S4-1 (June 2011) –
Facing north across the
soil nail repair area in
2011, for comparison with
2012 conditions (refer to
Photo S4-2).

Photo S4-2 (June 2012) –
Taken from near the same
location as Photo S4-1.
Note the displacement of
the stake visible in the
foreground of the photos,
which indicates a
retrogression. Continued
retrogression at the slope
crest, as well as
disturbance of the
vegetation by soil flows has
occurred. Overall the slope
appears more vegetated
and stable than previous
years.

Photo S4-3 (June 2012) – Facing south at the slide area. The instabilities in the upper, steeper portions of the slope are mostly unchanged from 2011 apart from settlement of the larger blocks. Retrogression of the slide continues to occur with large blocks sliding down and adding to the slide mass although at a seemingly slower rate than observed previously.

Photo S4-4 (June 2012) –

Facing north at the slide area with a view of the lower slope and river bank. Note the vane damage and the improved vegetation cover.
